Data Lifecycle Management (DLM) protects important data during its retention period It can also erase old data

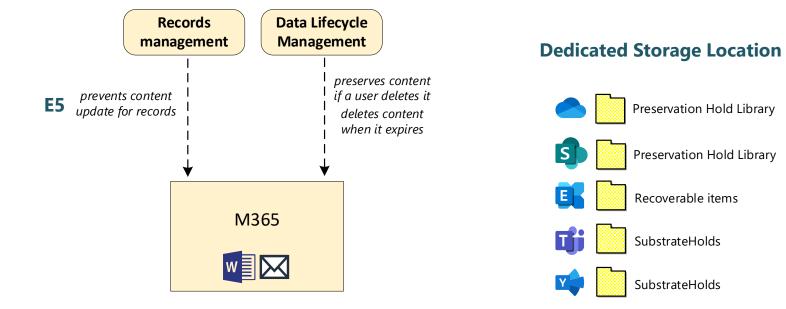

Records Management extends DLM to prevent records updates or deletion

Rules Application

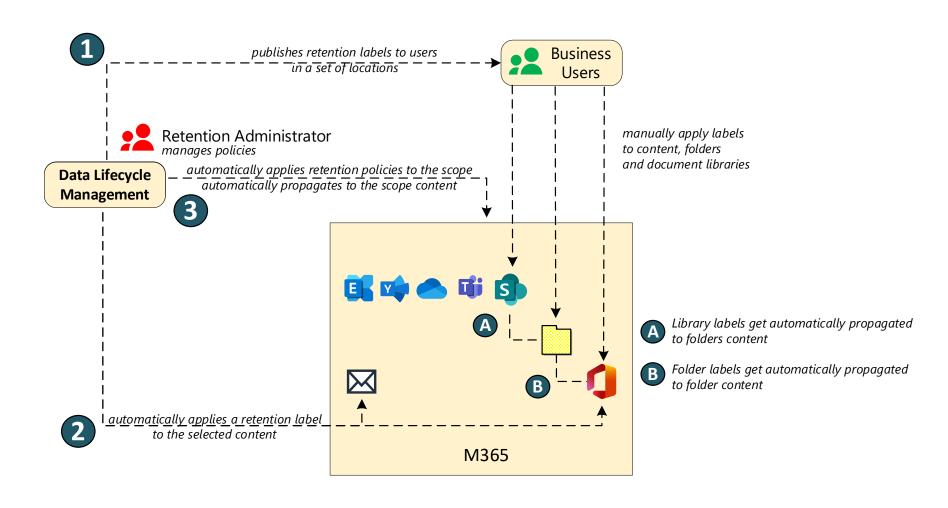

The phases can be mixed or managed independently.

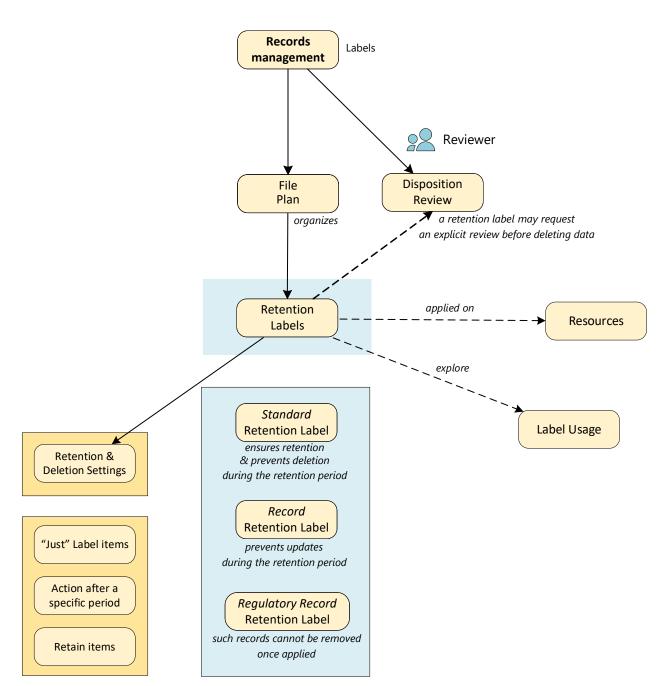

Examples: you may retain files at least for 3 years, then let the users delete then whenever they want You may let users decide to keep or delete files during 3 years, but issue an automatic purge when this period ends.

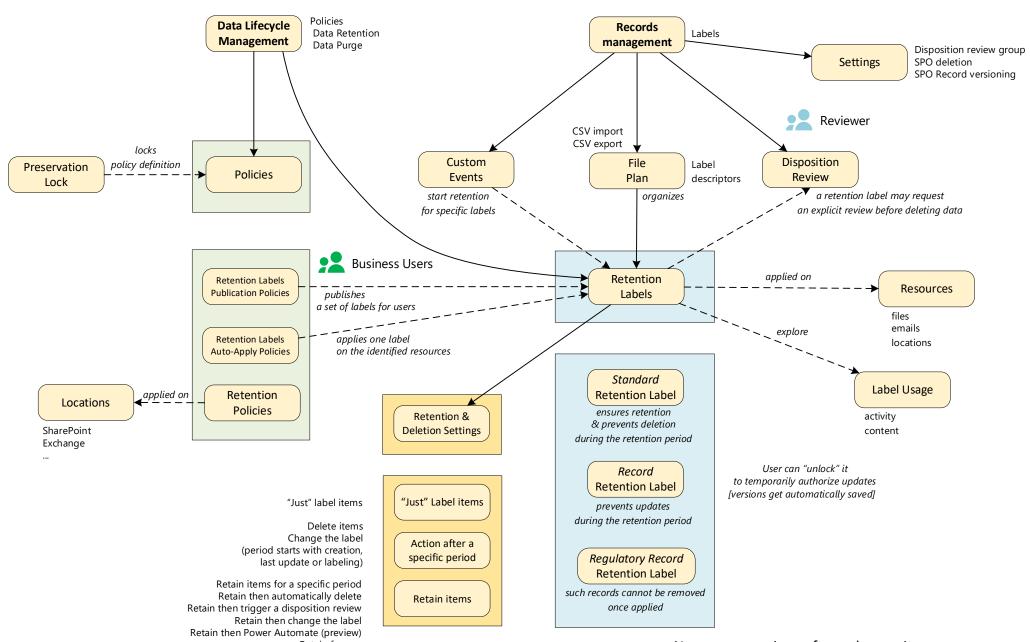

Policies

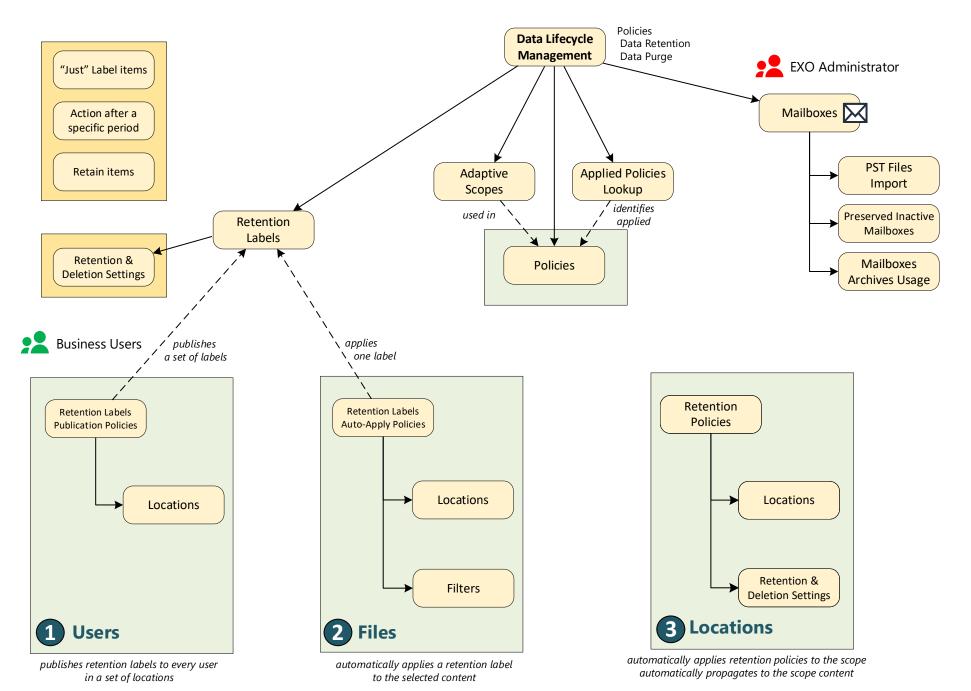

(retention starts with creation, last update,

labeling or a specific event)

Namespace : microsoft.graph.security

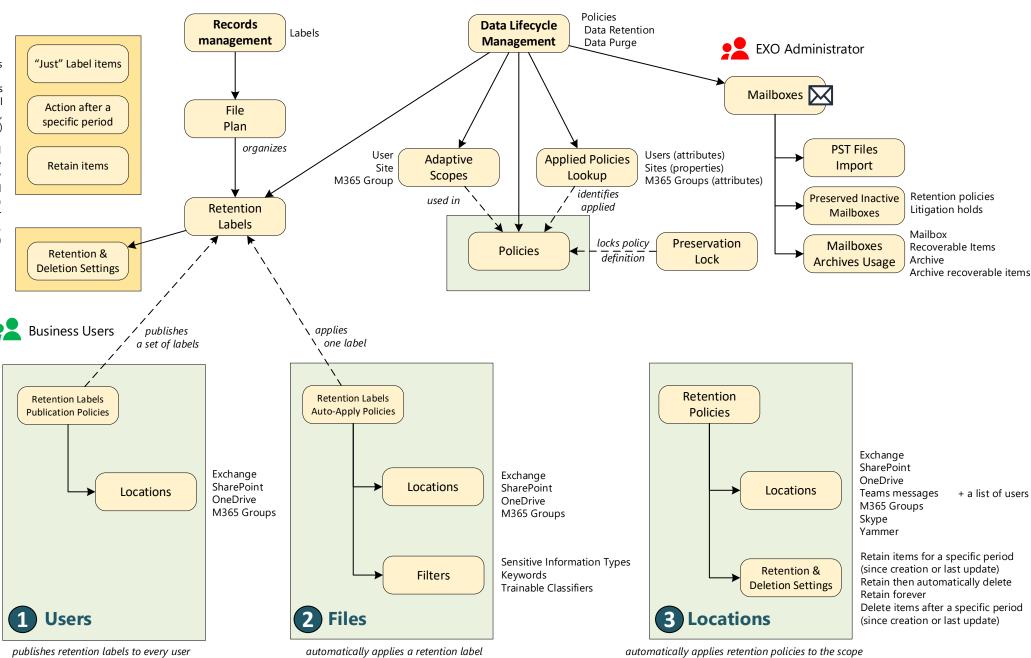

to the selected content

"Just" label items

in a set of locations

Delete items Change the label (period starts with creation, last update or labeling)

Retain items for a specific period Retain then automatically delete Retain then trigger a disposition review Retain then change the label Retain then Power Automate (preview) Retain forever (retention starts with creation, last update, labeling or a specific event)

automatically applies retention policies to the scope automatically propagates to the scope content
